Amazon Delivery Report

Data Date: 2022

amazonlogistics

General Conclusion

Delivery performance: Only 48.8% of orders are delivered on time. Delays are common in Semi-Urban areas and in Windy, Medium Traffic conditions.

Delivery vehicle: Van is fastest but more expensive. Motorcycle and Scooter balance cost and time for Metropolitan areas.

Effective shipper profile: Shipper aged 29-30, rating 4.6-4.7, operating mainly in Metropolitan, using Motorcycle.

Delivery cost by area & product: Semi-Urban has the highest cost. Grocery is the cost-optimized product group, whereas Jewelry and Home have high costs.

Delivery operation flow: The bottleneck occurs at the last mile of delivery: Pickup to On-time rate is only 48.8% despite Pickup rate being almost 100%.

Overall operating cost: Average cost 8.70K VND/order, high cost ratio concentrated in Semi-Urban and Van areas.

Several Suggestions

Optimize operational resources:
- Allocate Motorcycle/Scooter to Metropolitan to reduce costs.
- Review Van for Semi-Urban to balance speed and costs.

Improve shipper support policies:
- Apply bonus or financial support policy when delivering in Windy or Traffic Medium+ conditions.
- Train to handle traffic and weather incidents.

Optimize costs by product group:
- Prioritize promoting Grocery services.
- Review Jewelry and Home shipping policies to control costs.

Adjust operational processes:
- Develop optimal delivery routes for Semi-Urban.
- Increase on-time delivery rate by optimizing pickup and final delivery processes.
